It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as "runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

On Dec 16, 1999 this sequence version replaced g1:5763807.
For more information about this sequence or the Malaria Project, see http://www.sanger.ac.uk/Projects/P_falciparum. IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is n progress and the correct sequence may based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /codon_start=1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LOCUS
```

```
NOTICE: This sequence may not represent the entire insert of this cone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D.
McPherson, Department of Genetics, Washington University, St. Louis
MCPherson, Department of Genetics, Washington University, St. Louis
MCP. For additional information about the map position of this
sequence, see http://genome.wustl.edu/gsc

SOURCE INFORMATION:

The Reci-11 human BAC library was made from the blood of one male donor, as described by Osoegawa.K., Woon, P. Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J. J. and de Jong, P. J. (1998). An Improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:18. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or pleter de Jong and coworkers at the Roswell Park Cancer Institute
(http://bacpac.med.buffalo.edu)

The clone sequenced to the left is RP11-314B1, 2000 bp overlap; the clone sequenced to the right is RP11-86017. Actual start of this clone is at base position 161288 of RP11-314B1; actual end is at base position 166698 of RP11-813X12. NEIGHBORING SEQUENCE INFORMATION:

Data from AC069383 was used to finish this clone, AC068138.An unresolved di-trinucleotide repeat exists between 52436 and 52756

NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a "working draft' sequence. It currently

consists of 2 contigs. The true order of the pieces

is not known and thair order in this sequence record is

arbitrary. Gaps between the contigs are represented as

runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence

as soon as it is available and the accession number will

be preserved.

Isolated nucleic acid molecule for producing transgenic plants have altered characteristics such as resistance to a plant pathogen comprises promoter, inducible in response to physical stimulation

English 111pp; Page 98-101; Claim

1-aminocyclopropane-1-carboxylic acid synthase (ACC synthase, see AAY79292). The ACC synthase gence, AIM-1, is induced in response to mechanical strain, auxin and salt stress. The invention relates to the pGEL-1 promoter (see AA294266) that directs expression of the AIM-1. gene. pGEL-1 is capable of induction by physical and/or environmental stimuli in cells in which it is indigenous and, in the absence of any negative regulatory mechanism, is capable of constitutive expression in cells in which it is non-indigenous. The promoter can be used to direct expression of genes conferring useful traits on plants, such as improved resistance to a plant pathogen, altered autilitional characteristics, expression of a plantabody, altered biochemical pathway, altered expression of extreme to a plant pathogen. The colour. bean mung sequence is that of cDNA encoding present The

Exposure conditions were: 0.1 ppm ozone for 6 hours after one hour acclimation at 25 degrees C, 70 % relative humidity, 30 k lux and air current 30 cm/second. This gene will be useful for breeding air pollutant ozone-resistant trees, especially
                                                                                                                                                                                                                                                                                       Poplar 1-aminocyclopropane-1-carboxylic acid synthase gene PNACCS1.

```

This cDNA encodes a papaya 1-aminocyclopropane-1-carboxylic acid synthase production and control of ACC synthase in transformed plants and cells, especially to control of ACC synthase in transformed plants and cells, sepecially to control fruit ripening. The enzyme converts and cells, responsible for the ripening of fruit (ACC is converted to ethylene, which is responsible for the ripening of fruit (ACC is converted to ethylene by ACC oxidase). Commercial tropical fruit markets e.g. papaya production, require fruits in an adequately ripened state. Ripening is dependant on synthase coding sequences, the endogenous enzyme can be inhibited using antisense constructs, until it reaches its destination, then allowed to

Claim 1; Fig 1; 33pp; English.

This sequence, designated PNACCS2, is a 1-aminocyclopropane-1-carboxylic acid (ACC) synthase gene isolated from poplar trees which had been exposed to ozone. Exposure conditions were: 0.1 ppm ozone for 6 hours after one hour acclimation at 25 degrees C, 70 % relative humidity, 30 k lux and air current 30 cm/second. This gene will be
                                                                                                                                                                                                                                                                                                                                                                            358

This cDNA clone, designated pPHSacc49 (ATCC 98179), codes for a construction of the control of geranium (Pelargonium x hortorum cv. Sincerity). (See AAW60235) of geranium (Pelargonium x hortorum cv. Sincerity). Construction of the 2-butoxyethanol precipitation technique. This was converted to cDNA and screened with a probe generated by PCR complification (see AAV30128-29). The PHSacc44 (see AAV30134) and pPHSacc44 (see AAV30134) and rose ACC synthase cDNA clone pARSacc44 (see AAV30134) and pPHSacc44 (see AAV30134) and rose ACC synthase cDNA clone pRoseKacc7 (see AAV3030), are also claimed. These ACC synthase gones, or their pPHSacc44 (see AAV30314) and antisense orientation under control contr

The present sequence encodes Coffea arabica, coffee-fruit specific 1-aminocyclopropane-1-carboxylic acid (ACC) synthase.

ACC synthase con be used to control ethylane blosynthesis in coffee plants, as ACC synthase is an element of the ethylane blosynthesis pathway. Transformation of wild-type coffee plants with constructs containing the CDNA can also be used to block ACC synthase synthesis. The CDNA can also be used to block ACC synthase synthesis. The CDNA can also be used to block ACC synthase synthesis. The cDNA can also be used to controlled action are incapable of synthesising ethylene, which is necessary in the final stages of fruit ripening in coffee, therefore ethylane application to the entire plant can synchronise controlled, e.g. application to the entire plant can synchronise ripening. Coffee beans are preferably obtained from mature fruit, but non-uniform ripening has necessitated laborious hand-picking, or low ytelds and productivity when harvesting by strip harvesting or mechanical techniques. The ability to synchronise ripening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     e.g.

                                                                                                                 This sequence represents the novel gene, miacc2, which is a member of the mango ACC synthase multigene family. ACC synthase an enzyme involved in the pathway for ethylene blosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene often deleterious to crops, especially if some form of mechanical

wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either sense or antisense expression system may be used to control the regulation of plant development, in particular fruit ripening, reducing senescence and thus improving storage life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1071

RNA isolated from powdered, frozen fruit (i.e. tomatoes).

Recombinant phage containing inserts were plated, transferred to an itrocellulose filter and hybridised to zucchini pACCI cDNA as probe (see AAQ15131). A full-length cDNA from tomato, designated pACCI was recovered. Additional clones were isolated using the see also AAQ15132-Q15140.

                      1-aminocyclopropane-1-carboxylic acid synthase, LE-ACC2. ACC synthase are capable of catalysing the conversion of AdoMet (S-adenosyl methionine) to ACC and methyl thioadenosine (WTA). ACC DNA is useful for producing ACC synthase which is essential for the production of ethylene in higher plants, where ethylene is a determinant of fruit ripening. The ACC DNA is also useful for producing transgenic plants which are overproducers of or are deficient in ACC synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  470

                                                                                                                                                                                                                                                                                                                                                       The present sequence is a DNA encoding tomato (Lycopersicon esculentum) l-aminocyclopropane-1-carboxylic acid synthase (ACC). ACC synthase are capable of catalysing the conversion of AdoMet (S-adenosyl methionine) to ACC and methyl thioadenosine (MTA). ACC DNA is useful for producing ACC synthase which is essential for the production of ethylene in higher plants, where ethylene is a determinant of fruit ripening. The ACC DNA is also useful for producing transgenic plants which are overproducers
                                                                                                                                                                                                                                                                                                  Novel isolated DNA molecule encoding 1-aminocyclopropane-1-carboxylic acid synthase, LE-ACC2 useful for producing ACC synthase which is essential for the production of ethylene in higher plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         acttttttacactccacactctaaccacatacaccatatgggtttcaaggccatggacca 110
